# Causes For Traffic Accidents

Human factor : 80%

# Drowsy Driving

## ➤ How Big is the problem of Drowsy Driving?

Drowsy driving related accidents are on the increase

- England—About 20%; 30% on some roads
- Australia—Between 15-20% of all crashes
- New Zealand—13% of fatal crashes
- Germany—35% of fatal motorway crashes
- France—About 10%

### Drowsy Driver Gets Five-Year Sentence

Judge Sends Message After Reckless Act Killed Two in Pr. William

By Justin Blum  
Washington Post Staff Writer

Neal Edward Semich was feeling drowsy as he drove his Dodge sedan to a business meeting in February. He opened up a vent to stay alert.

But Semich, 35, of Fredericksburg, Va., dozed off anyway. He crossed a double yellow line on Route 28 in Prince William County, starting an oncoming driver who lost control of his car and struck

another vehicle. Two people died in the crash.

Semich drove away, later saying he was unaware he had caused the accident.

Yesterday in Manassas, as Semich begged for leniency and choked backed tears, Prince William Circuit Court Judge Richard B. Potter sentenced him to five years in prison.

The judge said he was exceeding state sentencing guidelines, which recommend a maximum term of six

months, because of the nature of the crime and to send a message.

"If you're tired and falling asleep as you drive, you need to get off the road," Potter said. For drivers who may consider getting on the road when they're drowsy, he said, "the lesson from this case is you go to jail."

Semich, an electrical engineer for the Navy, had pleaded guilty in June to two counts of reckless driving and one felony hit-and-run. See DRIVER, A14, Col. 1

FILE PHOTO/PRINCE WILLIAM POLICE  
Neal Edward Semich, seeking leniency, said he has sleep apnea.

## ➤ What are the Characteristics of Drowsy Driving Crashes?

In Korea, drowsy driving is not punished for violation of the traffic regulations

Recently there have been legislative efforts to reduce the number of drowsy drivers on the road

In united states, when the driver involved in a fatal accident without sleep for 24 consecutive, he was sentenced five-year

Drowsy drivers are going to be punished when they cause fatal accidents

# Distracted Driving

Texting/DMB

Alcohol

Drowsy

- Attention dispersion behavior

- Traces, avoidance of danger

- ▶ Some arousal

- No traces, No skid mark

- ▶ Complete carelessness

- Sleeplessness for 18 hours = a blood-alcohol level 0.05%
  - ※ doubled reaction time, suspension of license
- Sleeplessness for 24 hours = a blood-alcohol level 0.15%
  - ※ four times in reaction time , revocation of license

# Road Safety Facilities to prevent Drowsy Driving

Warning by *sight, hearing, touch*

these measures have no effect

[Pinwheel]

[Banner]

[Siren]

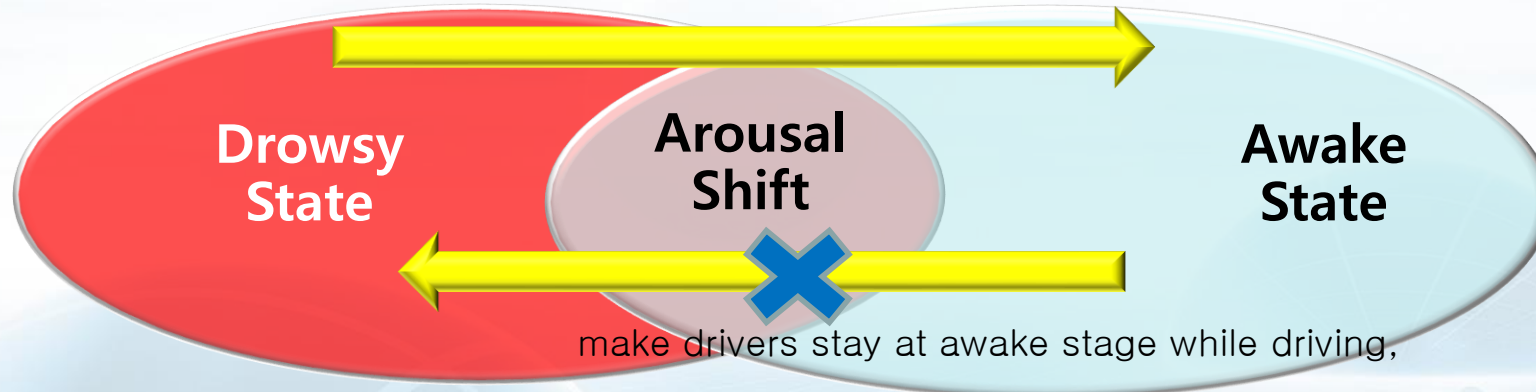

[Rublestrip]

[Raised Marking]

wake drowsy drivers from drowsy state to awake state

100km/h ( 3seconds, 100m)

Pre-emptive Measures

# Pre-Emptive Measures to prevent Drowsy Driving, 4E

## Engineering

: Car company, Private sector

V2V, V2I

Gadget in vehicles

detect drowsy state and give warning

## Education

: Government

White book for anti-drowsy

Campaign

## Environment

: Road management

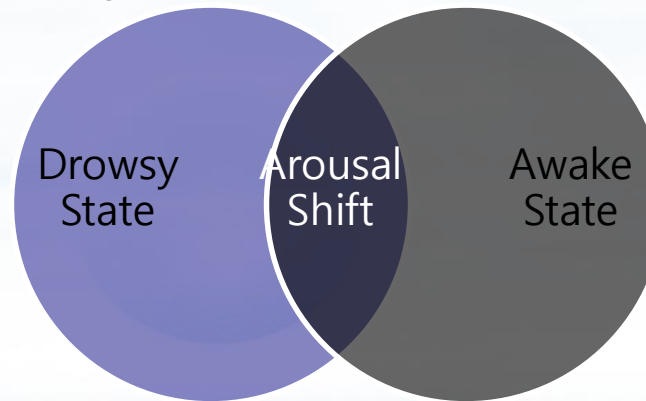

Rest area

## Enforcement

: Government

Punishment

Driving hours limit for freight car

# Engineering Technology

- Road-based : Warning of drowsy driving risk areas (installation of facilities, etc.)
- Driver-based : Detects drowsiness through driving behavior and pupil condition
- Vehicle-based : Detect/control drowsiness through front/rear distance and driving behavior
- Others: Device and app-based drowsiness detection/warning

# Education

- Vulnerable group : the younger, male, shift worker

White book for anti-drowsy

# Enforcement

- “Maggie’s Law” (New Jersey, 2003)
- “Rob’s Law” (Massachusetts, 2005)

amount of driving hour a day and continuous driving time

# Drowsy Driving Strategy

## ❖ Setting the direction of propulsion

# Shelter (small-sized rest area) for drowsy drivers

- Installed on a section where the distance between rest areas exceeds 15km
- Amenities : Parking lots, Pergola, Benches, etc.
- 45% reduction in traffic accident caused by driver's drowsiness (340 -> 188)
- As of 2018, total of 218 shelters are in operation

# Sleeping Banner

| Classification                         | 2014 JUN~SEP | 2015 JUN~SEP | Change |
|--|--------------|--------------|--------|
| Total number of traffic accidents      | 798          | 679          | -119   |
| Total traffic fatalities               | 81           | 84           | +3     |
| Number of accidents due to drowsiness  | 155          | 123          | -32    |
| Number of deaths due to drowsy driving | 24           | 23           | -1     |
| Fatality rate due to drowsy driving(%) | 15           | 19           | +4%    |

| Classification                         | 2015년 |     |     |     |     |     |     |     |     |  |
|--|-------|-----|-----|-----|-----|-----|-----|-----|-----|--|
|  | JAN   | FEB | MAR | APR | MAY | JUN | JUL | AUG | SEP |  |
| Total number of traffic accidents      | 229   | 191 | 217 | 213 | 203 | 170 | 177 | 160 | 172 |  |
| Total traffic fatalities               | 15    | 12  | 19  | 14  | 16  | 23  | 21  | 20  | 20  |  |
| Number of accidents due to drowsiness  | 31    | 46  | 32  | 33  | 40  | 37  | 22  | 31  | 33  |  |
| Number of deaths due to drowsy driving | 8     | 6   | 2   | 7   | 4   | 8   | 2   | 8   | 5   |  |
| Fatality rate due to drowsy driving(%) | 26    | 13  | 6   | 21  | 10  | 22  | 9   | 26  | 15  |  |

# Rest Areas

completely separated from the main road

Amenities :  
toilets, restaurants,  
gas station, parks.

a new rest area, which is located above the expressway in the air

In Korea, every 40km on expressway  
there are some problems about the safety in our rest area  
an access road to the rest area is a little short

# Safety Problems in Rest Areas

For 3 years, 200 accidents at the rest area causing 15 fatalities

As a vehicle enters the rest area, a vehicle is supposed to start reducing its speed

And as it approaches the parking lot, its speed should be reduced down to 20km/h.

But most of the vehicles entering the rest area don't reduce their speed, so the average measured speed is 40~50km/h

# Safety Problems in Rest Areas

## Overseas Case

- ✓ Through channelization of entry part, ***Separation of flow and parking compartments by vehicle type***

Netherlands

Japan

- ✓ Depending on the site and the type of approach, ***various rest area arrangements***

Japan

UK

- ✓ Installation of ***user-centered guidance systems and walking facilities***

pedestrians road Shelter

Parking lot sidewalk

empty car Information System

# Safety Problems in Rest Areas

## Ramp Geometry

### ✓ Current Status length of rest area ramp

| Classification |                   | Not Installed | 30m or less | 30~60m | 60~90m | 90~120m | 120~150m | 150m or more | Total |
|----------------|-------------------|---------------|-------------|--------|--------|---------|----------|--------------|-------|
| Entrance ramp  | Status(locations) | 15            | 18          | 34     | 32     | 18      | 7        | 11           | 135   |
|                | Ratio(%)          | 11.1          | 13.3        | 25.2   | 23.7   | 13.3    | 5.2      | 8.1          | 100.0 |
| Exit ramp      | Status(locations) | 8             | 15          | 55     | 19     | 14      | 10       | 14           | 135   |
|                | Ratio(%)          | 5.9           | 11.1        | 40.7   | 14.1   | 10.4    | 7.4      | 10.4         | 100.0 |

### ✓ Current Status installation angles of rest area ramp

| Classification    | Missing | Less than 5° | 5° ~10° | 10° ~15° | 15° ~20° | 20° and more | Total |
|-------------------|---------|--------------|---------|----------|----------|--------------|-------|
| Status(locations) | 3       | 12           | 37      | 47       | 28       | 8            | 135   |
| Ratio(%)          | 2.2     | 8.9          | 27.4    | 34.8     | 20.7     | 5.9          | 100.0 |

# Safety Problems in Rest Areas

## Entrance Connection of Plaza

### ✓ Installation type of separation facility at the point of Entrance connection

– Plaza-type connections (Type 1) without guidance facilities is the majority, about 110 locations (81.5%)

|                | Type 1 : Absence of guidance facilities (Plaza type)                              | Type 2 : Installation of guidance facilities (Road marking guidance)               | Type 3 : Installation of guidance facilities (Traffic island type)                  |
|----------------|---|--|---|
| Classification |  |  |  |
| Locations (%)  | 110(81.5)   | 23(17.0)   | 2(1.5)  |

### ✓ Status of parking space installation at the Entrance connection

– 57 rest areas (42.2%) are operating with parking spaces installed within the connection area

⇒ *Parking raw linkage*(35 locations, 25.9%) ⇒ *Additional installation of separate parking spaces*(22 locations, 16.3%)

|                | Type 1 : No parking space installed at the connection point                         | Type 2 : Installation of parking lot with connection section (Parking lot linked)    | Type 3 : Installation of parking lot with connection section (Additional installation of separate parking space) |
|----------------|---|--|--|
| Classification |  |  |                             |
| Locations (%)  | 78(57.8)  | 35(25.9)   | 22(16.3)   |

# Safety Problems in Rest Areas

## Pedestrian Flow

- ✓ Indiscriminate pedestrian access to the entire rest area : conflict with vehicles passing through the parking lot, inconvenience to pedestrian
  - ⇒ It is necessary to **minimize conflict points with vehicles** by installing Pedestrian–Vehicle Separation and pedestrian guidance facilities
- ✓ Most of the parking plazas in domestic rest areas only install parking surface classification and crosswalk road markings by road markings
  - ⇒ Effective pedestrian guidance is not being implemented

### Domestic pedestrian facility Installation type

#### Crosswalk pavement markings

28 locations (17%)

#### Crosswalk in the form of a pedestrian walkway

24 locations (14%)

#### Pedestrian facilities connected to sidewalks/green spaces

10 locations (6%)

# Safety Problems in Rest Areas

## Exit connection

- ✓ 85 Plaza-type access points without guidance facilities, and 46 locations with a phased merging system using channelization facilities

| Classification | Type 1<br>Plaza | Type 2<br>Route differentiation markings  | Type 3<br>Lane + Channelization facility<br>(Phased merging system))               |
|----------------|-----------------|---|--|
|                |                 |  |  |
| Locations (%)  | 85(62.9)        | 4(3.0)  | 46(34.1)   |

- ✓ Most domestic rest areas have exit-type gas stations (159 locations, 98%)
- ✓ Depending on the location of the gas station, unreasonable vehicle traffic patterns such as Crossing, Weaving, and driving in the opposite direction may occur.

# Safety Problems in Rest Areas

## Problem Analysis(Entrance connection)

- ✓ Insufficient deceleration function of deceleration lane (①) and Entrance ramp (②) → Speeding when entering rest area
  - On-site measurements show that most vehicles exceed the speed limit when passing through the entry nose section
  - ⇒ Actual average driving speed (V) : 60 ~ 70km/h (design speed 40km/h)
- ✓ Unclear vehicle path at the Entrance connection(③) → Abnormal driving path occurs
  - ※ Driving behavior of entering vehicles at plaza-type connection without guidance facilities

- Route ① : normal entry through circular driving(70%)
- Route ② : Straight-line route passing through the center of the Entrance connection (30%)

# Safety Problems in Rest Areas

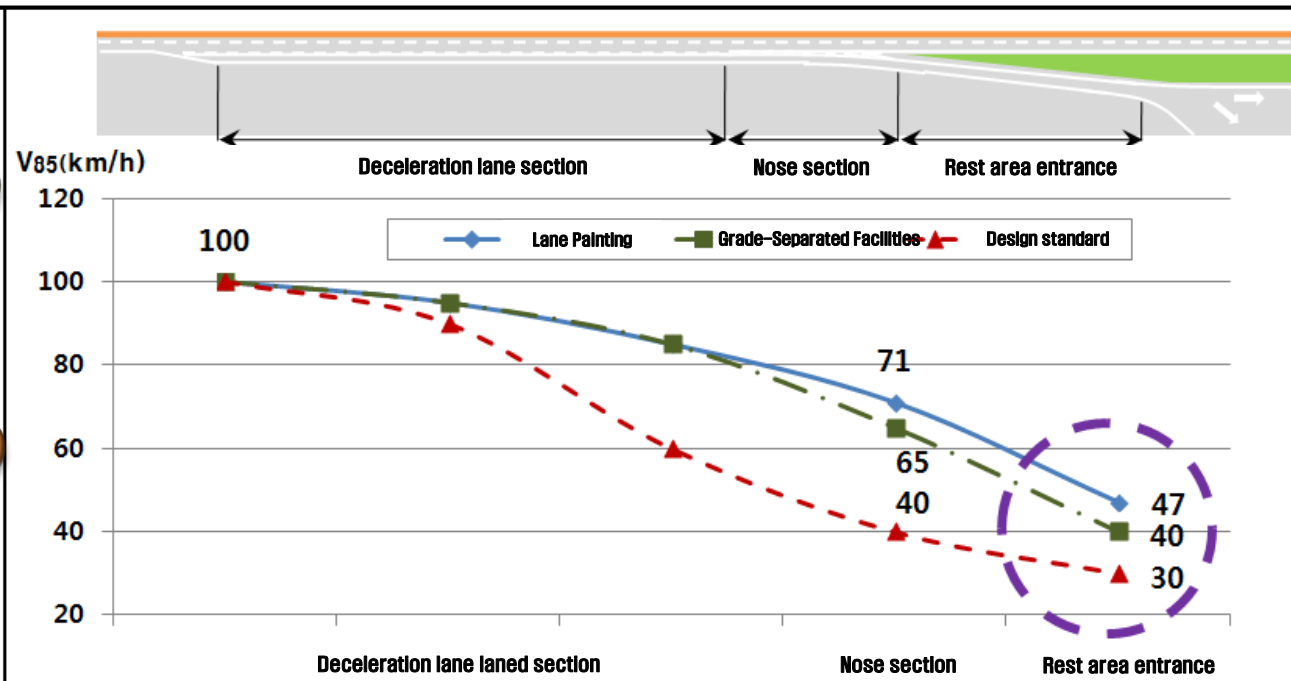

## Problem Analysis(Entrance connection)

- ✓ At the rest area entrance, grade-separated facilities are installed to slow down vehicles and separate traffic flows by vehicle type and direction to guide driving paths
- ⇒ When installing a Grade-Separated Facilities at the entrance, the speed of entering the rest area is reduced and the separation of traffic lines is improved

Before the Installation of Grade-Separated Facilities

After the Installation of Grade-Separated Facilities

# Safety Problems in Rest Areas

## Problem Analysis(Plaza area)

- ✓ Conflict between vehicles and pedestrians in the plaza area(④)
  - It provides space rather than path, so it is impossible to predict the point of conflict

- If the parking aisle is wide, the vehicle's driving path becomes unpredictable.
- Pedestrian crossing points cannot be anticipated

## Direction for Improvement (Plaza area)

Painting of lane markings on the driving path to make the vehicle passage in the plaza area clear

- Speed bumps and pedestrian pathways are installed to limit the driving speed within the plaza area to 20 km/h or less

# Safety Problems in Rest Areas

## Problem Analysis(Exit connection)

✓ At the exit connection (⑤), the exit traffic flow is unclear, leading to conflicts with refueling vehicles

- Traffic flow ①, ②: Normal exit (70%)
- Traffic flow ③: Abnormal straight driving path (30%), cutting across empty parking spaces and passing through the center of the exit connection.

## Direction for Improvement (Exit connection)

✓ Grade-separated channelization facilities are installed to guide phased merging based on vehicle paths and reduce the number of conflict points

# Safety Problems in Rest Areas

## Direction for Establishing Guidelines

### Entrance Ramp

Speed Reduction Measures

- ✓ Step-by-step speed reduction measures
- ✓ Implementation of safety facilities

### Plaza Entrance Section

Clarification of Vehicle  
Traffic Flow

- ✓ Systematic organization of entry vehicle paths
- ✓ Grade-separated channelization measures

### Rest Area Plaza Section

Improvement of Vehicle-  
Pedestrian Conflicts

- ✓ Pedestrian guidance facility measures
- ✓ Parking layout and parking space improvement measures
- ✓ Traffic flow improvement for buses and large vehicles

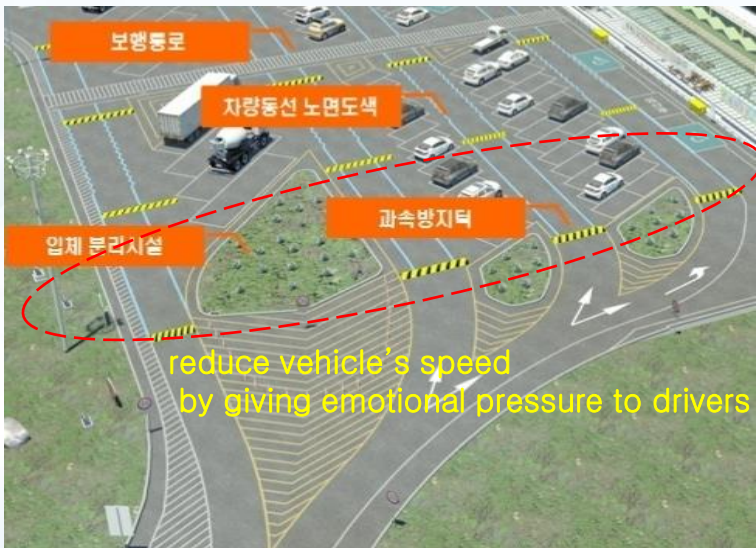

### Rest Area Exit Section

Reduction of Conflicts  
Between Exiting Vehicles

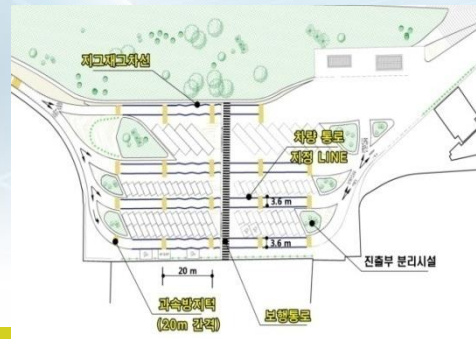

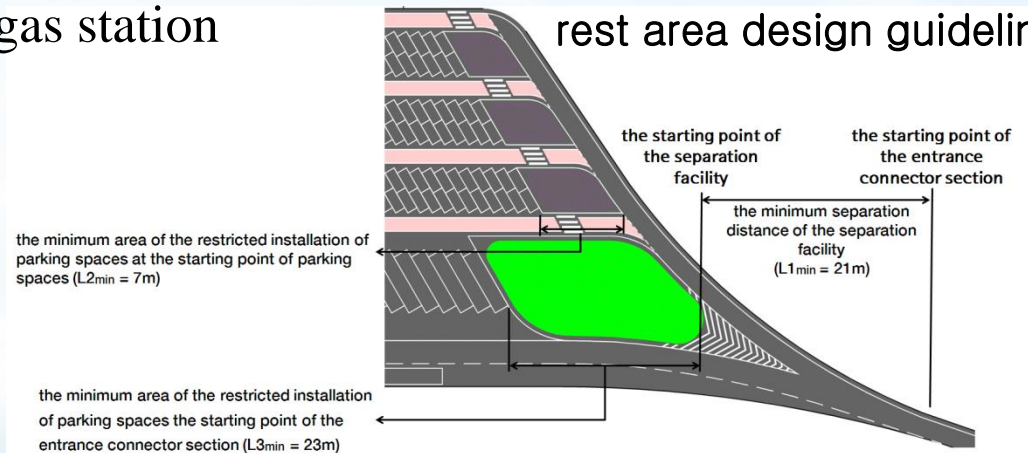

- ✓ Systematic organization of exit vehicle paths
- ✓ Reduction of conflicts with refueling vehicles

# Safety Improvements in Rest Areas

road markings on the surface to make drivers reduce their speed  
 separate facilities such as traffic island to separate small vehicles and large vehicle.  
 real humps and zigzag road markings at the constant interval  
 paths for pedestrians to ensure safe access into facilities.  
 traffic islands assign paths for exit and gas station

## rest area design guideline

# Earlier Reaction

Probability of having an accident

A study from Langwieder, based on GIDAS, the German In-Depth Accident Study, analysed the braking behaviour before an accident happened. Result: more than 50% did not brake at all (0-2 m/s<sup>2</sup>).

A study from Enke shows that compared to crossing accidents and accidents with oncoming traffic, rear end accidents (or forward collision accidents) have the highest potential for driver warning systems.

If people would react 0.5s earlier, more than 60% of the accidents could be prevented.

Source: GIDAS database, Prof. Langwieder

# Advanced Driver Assistance System

**Lane Departure Warning**  
warns the drivers when  
breaching the lane marking

secure earlier reaction time

**Forward Collision Warning**  
warns the drivers if frontal  
collision is imminent

enough time for a drivers to react like braking to reduce speed

# Effects of FCW, LDW

100 trucks were equipped with these system and all warning alarms were monitored for 6 months

## Frequency of warning alarms

| Types | A |     | B  |      | C  |      | D  |      | E |      | F |     |
|-------|---|-----|----|------|----|------|----|------|---|------|---|-----|
|       | # | %   | #  | %    | #  | %    | #  | %    | # | %    | # | %   |
| FCW   | 1 | 1.3 | 35 | 45.5 | 6  | 7.8  | 27 | 35.1 | 8 | 10.4 | 0 | 0.0 |
| LDW   | 4 | 5.2 | 27 | 35.1 | 12 | 15.6 | 26 | 33.8 | 6 | 7.8  | 2 | 2.6 |

| 6 ~ 7                          | 35,431       | 91.40%            | 227   | 175   | 8.90%   | 80  |
| 7 ~ 8                          | 27,690       | 92.70%            | 230   | 178   | 9.40%   | 91  |
| 8 ~ 9                          | 22,553       | 93.60%            | 235   | 181   | 9.70%   | 102   |
| 9 ~ 10                         | 17,946       | 94.40%            | 235   | 182   | 10.00%  | 113   |
| 10 ~ 11                        | 15,057       | 95.10%            | 237   | 184   | 10.30%  | 124   |
| ⋮                              | ⋮            | ⋮                 | ⋮   | ⋮   | ⋮   | ⋮   |

road managers' preemptive actions are also required beyond individuals' effort.

# High Continuous Driving Hours Index means High Accidents?

- › Place IC : 1,360
- › Sections in order of continuous driving hours index from highest to lowest
  - # of Total IC Sections : 1,360
  - # of upper 5% IC Sections : 68, # of lower 5% IC Sections : 68

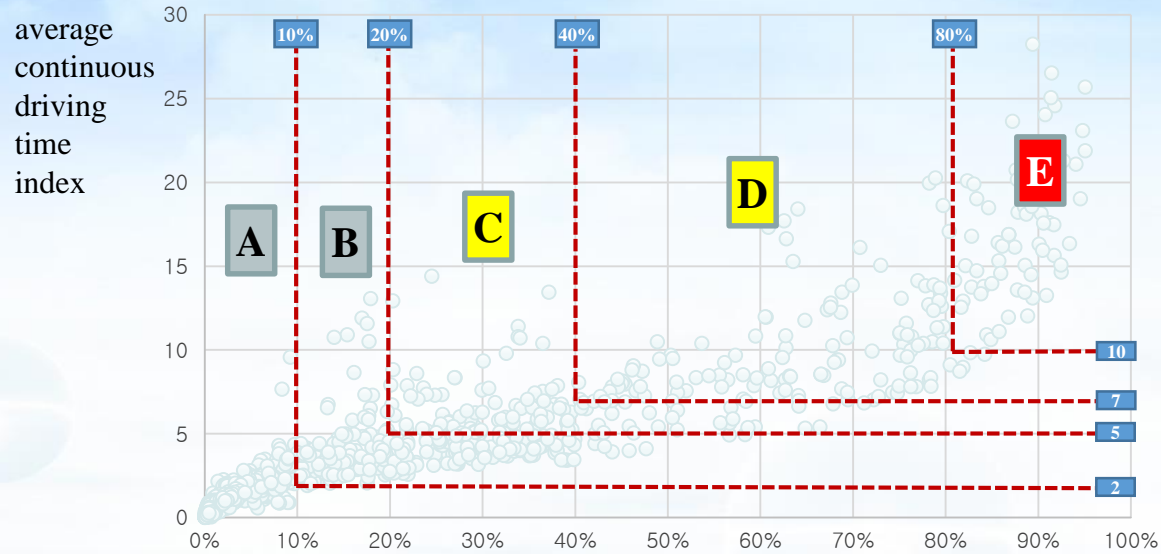

| IC Sections | # of IC Sections | # of IC Sections Where Drowsy Driving Accidents happened | # of Total Drowsy Driving Accidents (Rate) | # of Total Drowsy Driving Fatalities (Rate) |
|-------------|------------------|--|--|---|
| Upper 5%    | 68               | 64 (94.1%)   | 3,089 (12.0%)                              | 69 (14.1%)                                  |
| Lower 5%    | 68               | 37 (54.4%)   | 169 (2.35%)                                | 5 (1.02%)                                   |

It would be more effective to install road facilities on the sections with a high continuous driving time index than on random zones to prevent drowsy driving accidents.

# Risk of Drowsy Driving : scale and frequency of each index value

➤ how large an index value is, how often the large index value occurs over a year

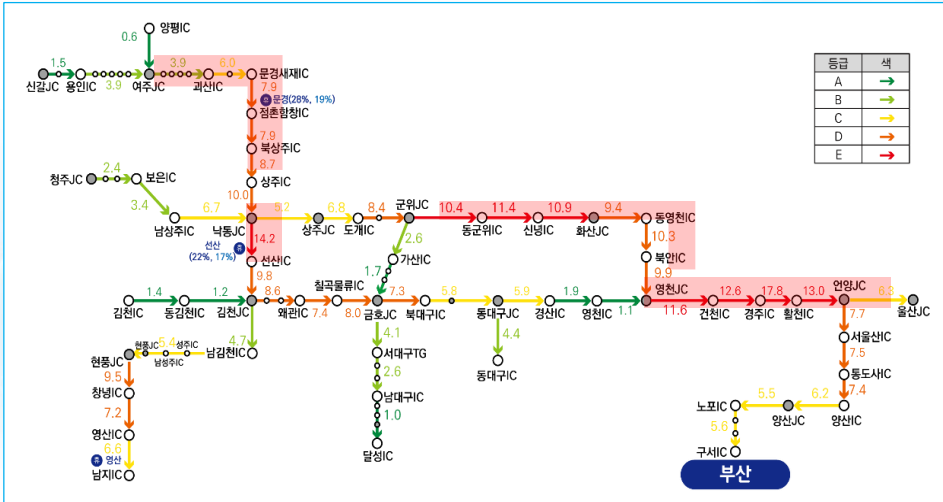

Grade A, B C, D E

| Grade    | # of Sections  | Average Continuous Driving Hours Index | Number of Vehicles more than 2 Hours Continuous Driving | Ratio of more than 2 Hours Continuous Driving | Average Continuous Driving Hours (Minutes) |            |
|----------|----------------|--|---|---|--|------------|
|          |                |  |   |   | Upper1%                                    | Lower 5%   |
| A        | 851            | 0.8                                    | 3   | 2.6%  | 124  | 100        |
| B        | 327            | 3.2                                    | 10  | 6.3%  | 174  | 141        |
| C        | 88             | 5.9                                    | 17  | 7.9%  | 192  | 154        |
| D        | 64             | 8.8                                    | 24  | 8.4%  | 205  | 160        |
| <b>E</b> | <b>49 (4%)</b> | <b>13.3</b>                            | <b>35</b>   | <b>9.8%</b>                                   | <b>220</b>                                 | <b>173</b> |

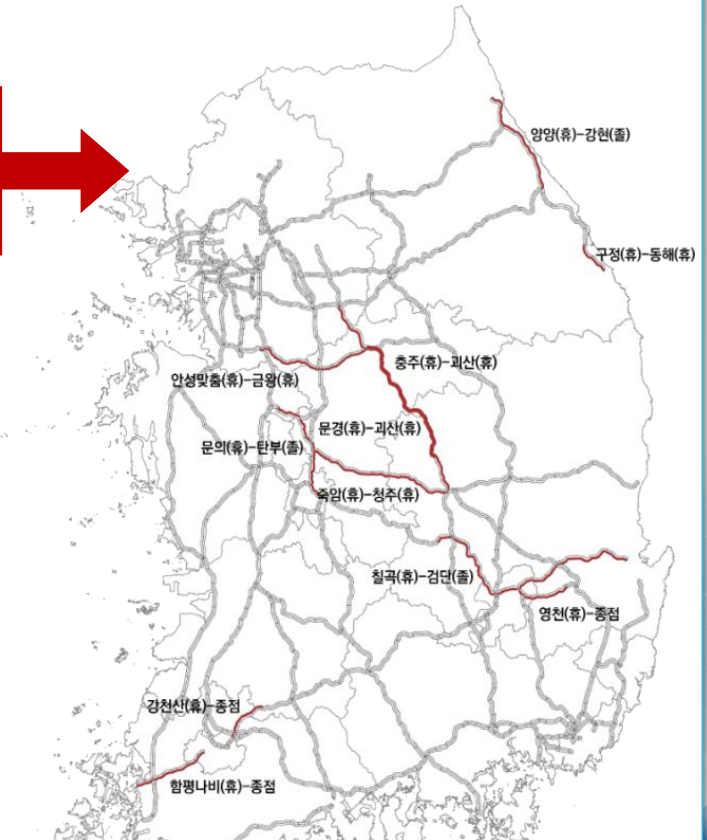

# Drowsy Driving Danger Areas : Long Driving + Congestion

- Index value goes up as the travel distance increases
- Because of the traffic jam, the travel distance has not increased but the driving time has increased

We should prioritize these sections and manage them as dangerous zones by installing horizontal rumble strips, banners, drowsy notifications, and VMS message displays

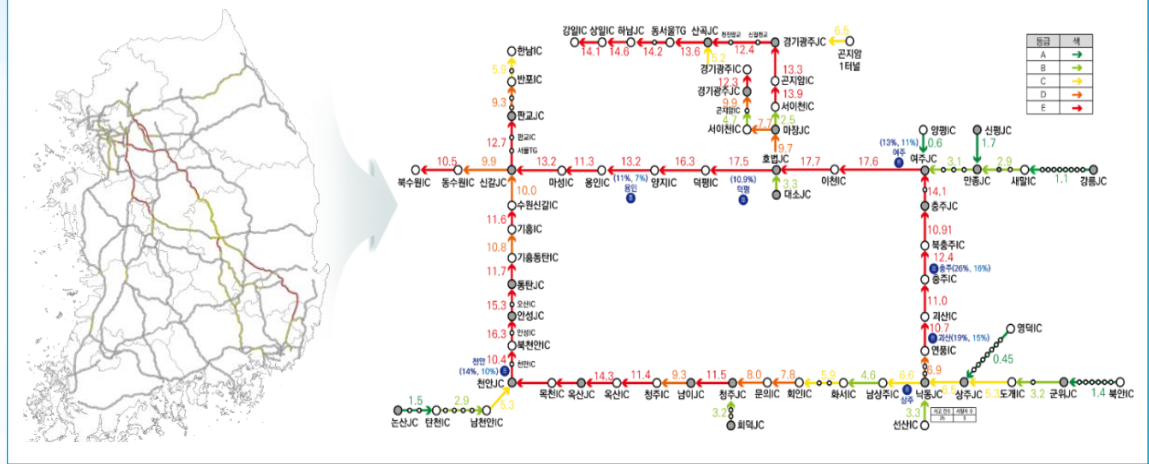

# Countermeasures for Drowsy Driving

## ➤ Prioritize installing the facilities on the sections with a high risk of drowsy driving

\* Total sections on expressways : 1,379

| Grade | # of Sections | More than 4-Drowsy Driving Accidents |       | More than 2-Drowsy Driving Fatalities |       |
|-------|---------------|--------------------------------------|-------|---------------------------------------|-------|
|       |               | # of Sections                        | Rate  | # of Sections                         | Rate  |
| A     | 851           | 324                                  | 38.1% | 41                                    | 4.8%  |
| B     | 327           | 180                                  | 55.0% | 32                                    | 9.8%  |
| C     | 88            | 41                                   | 46.6% | 11                                    | 12.5% |
| D     | 64            | 39                                   | 60.9% | 12                                    | 18.8% |
| E     | 49            | 36                                   | 73.5% | 14                                    | 28.6% |

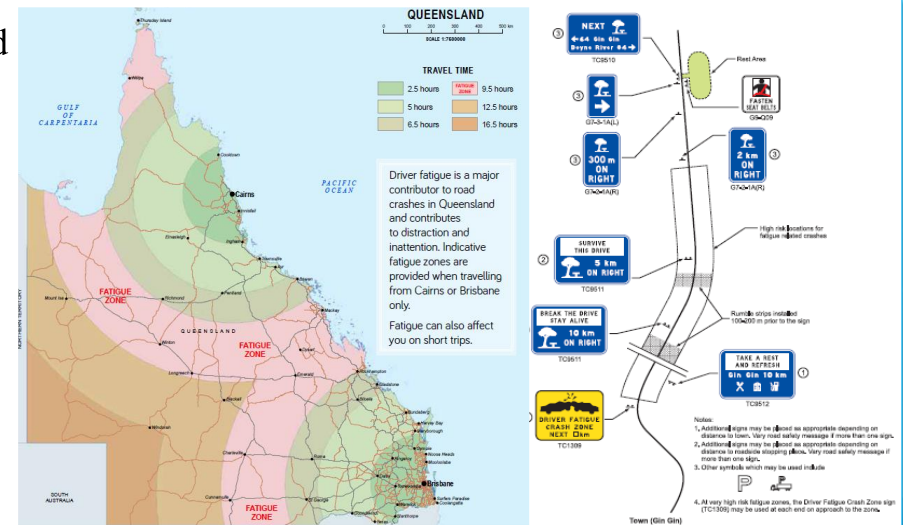

\* risk of drowsy driving evaluated by the continuous driving time index

## ➤ Areas where having High Continuous Driving Hours Index and Congested, ➡ High Drowsy Driving Risk Area

## ➤ Countermeasures by Characteristics for Highway Sections

- Considering Vehicle Routing Plan,
- Reduce the interval between Rest Areas or
- Increase the numbers of Rest Areas

# Driver Monitoring System

## I. Overview

- In 2024, 95% of traffic accidents were caused by 'human factors' such as inattention, drunk driving, and drowsy driving.
- Among highway fatalities, 70% of deaths were due to drowsy driving and inattention (based on data from 2019~2023, over 5 years).

| Year  | 2019 | 2020 | 2021 | 2022 | 2023 |
|---|------|------|------|------|------|
| Total Fatalities (persons)                  | 176  | 179  | 171  | 156  | 150  |
| Drowsiness/Inattention Fatalities (persons) | 120  | 130  | 121  | 119  | 101  |
| Drowsiness/Inattention Fatality Rate (%)    | 68%  | 73%  | 71%  | 76%  | 67%  |

- To prevent such accidents, the need for In-cabin systems is increasing alongside external vehicle systems(Out-Cabin).
- DMS (Driver Monitoring System) is a type of In-cabin system, and countries that have proactively adopted DMS have seen effective accident prevention.

# Driver Monitoring System

## II. In-Cabin Sensing

### > In-Cabin Sensing

: A technology that detects the state of drivers and passengers inside the vehicle to provide a safe environment.

※ DMS, IMS, and DIMS are representative systems

DMS(Driver Monitoring System)

- ✓ Forward Inattention
- ✓ Drowsiness Alert
- ✓ Alcohol Status

IMS(Interior Monitoring System)

- ✓ Occupant Presence in Vehicle
- ✓ Object Detection in Vehicle
- ✓ Occupant Classification (Child, Pet, etc.)

DIMS(Driver and Interior Monitoring System)

- ✓ DMS+IMS

### ◎ DMS(Driver Monitoring System)

- Also called DSM (Driver State Monitoring), this system analyzes a driver's blinking, face direction, etc., using sensors installed on the dashboard to detect the driver's state

### ◎ IMS(Interior Monitoring System)

- Detects passengers and objects inside the vehicle using sensors to recognize occupant information, movements, and items like wallets and mobile phones.

### ◎ DIMS(Driver and Interior Monitoring System)

- A single system that integrates sensors from both DMS and IMS

## III. International DMS Regulations and Certification Evaluations

- **Automobile-related regulations and certification evaluations tend to follow European trends, with UNECE and Euro NCAP being key organizations.**

### UNECE

(United Nations Economic Commission for Europe)

## UNECE

- ✓ United Nations Economic Commission for Europe
- ✓ Develops standards and best practices in various fields (trade, transportation, energy, etc.) for member countries
- ✓ Regulations are mandatory
- ✓ Most domestic automobile regulations are based on UNECE standards

### Euro Ncap

(European New Car Assessment Program)

- ✓ European New Car Assessment Program
- ✓ Tests various factors defined by NCAP and classifies results into a 1-star to 5-star rating
- ✓ Certification evaluation, not mandatory
- ✓ Has significant influence on the automobile industry

## III. International DMS Regulations and Certification Evaluations

### Drowsy and Distracted Driving-UNECE

- **Installation of DMS obligations related to drowsy driving and carelessness in accordance with UNECE regulations**

#### **[DDAW(Driver Drowsiness and Attention Warning)] (Regulation 2021/1341)**

- Evaluate the driver's condition by analyzing the driver's driving pattern or steering pattern
- Mandatory installation on vehicles (passengers, buses, trucks) that will be released from July 2022
- Vehicles with a maximum design speed of less than 70km/h are exempt from mandatory installation

#### **[ ADDW (Advanced Driver Distraction Warning)] (Regulation 2023/2590)**

- Evaluate the driver's condition by analyzing the driver's face and gaze
- Mandatory fit on vehicles (passengers, buses, trucks) that will be released from July 2024

## III. International DMS Regulations and Certification Evaluations

### Drowsy and Distracted Driving-Euro Ncap

#### ➤ Among Euro Ncap protocols, DMS evaluation is conducted in the safe driving field

The manufacturer shall submit a document demonstrating the performance of the driver condition monitoring system and Euro & Cap will conduct a test to verify the document

#### <Driver status assessment type>

| Distraction   | Fatigue  | non-response(sudden illness)   |
|---|--|--|
| Long-term Distraction (distraction for more than 3 seconds) | Drowsiness<br>(KSS* drowsiness level 7 or higher)                    | <ul style="list-style-type: none"><li>• Failure to return gaze within 3 seconds after a warning</li><li>• Gaze deviates significantly from the front</li><li>• Eyes closed for more than 6 seconds</li></ul> |
| Short-term Distraction<br>(repeated brief distraction)      | Microsleep<br>(Eyes closed for less than 3 seconds after drowsiness) |  |
| Use of mobile phones<br>(Repeatedly looking at your phone)  | Sleep<br>(Eyes closed for more than 3 seconds)                       |  |

\* **KSS Drowsiness Scale: A self-reported scale for assessing the degree of drowsiness**

\* **Activated when the vehicle is traveling at a speed of 10 km/h or more**

## III. International DMS Regulations and Certification Evaluations

### Drowsy and Distracted Driving-DOT

#### ➤ DOT (Department Of Transportation)

In 2021, the U.S. Department of Transportation introduced a bill to fund research on the impact of distracted driving on accident rates and the effectiveness of driver monitoring system

**The bill includes provisions for reviewing regulations on implementing driver monitoring systems in new vehicles.**

# Driver Monitoring System

## IV. Driving Simulator Center Experiment

### ③ Experiment on Collecting Biometric Data Related to Alcohol/Drowsiness Response (LG)

- LG Electronics AI Research Lab is developing a driver monitoring system for detecting alcohol impairment and drowsy driving.
- Since real-world alcohol/drowsy driving tests cannot be conducted, experiments are performed using a driving simulator.
